

## EXERCISES 2: CELL THEORY FOR ALGEBRAS

### 1. EXERCISES

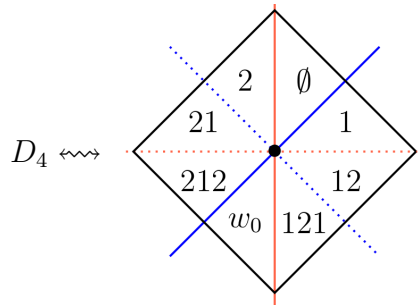

**Exercise 1 (Diagram algebras and  $H$ -reduction).** Recall the arguably most important diagram monoids:

Symbol	Diagrams	Symbol	Diagrams
$pPa_n$		$Pa_n$	
$Mo_n$		$RoBr_n$	
$TL_n$		$Br_n$	
$pRo_n$		$Ro_n$	
$pS_n$		$S_n$	

Fix some field  $\mathbb{K}$ . In all cases, the respective algebras are obtained by evaluating floating components to a fixed  $\delta \in \mathbb{K}$ . (If that doesn't make sense to you, then I have messed up: my bad...)

- (a) Classify the simple modules for your favorite(s) of these diagram algebras.
- (b') If you know the quantum versions of these algebras, such as the BMW algebra, then try those as well.

**Exercise 2 (Finite fun with dihedral groups – classical).** Let  $\emptyset$  denote the unit and let  $D_n = \langle 1, 2 | 1^2 = 2^2 = (12)^n = \emptyset \rangle$  be the dihedral group of the  $n$  gon.

- (a) Use the Magma online calculator (see below) to guess the classification of simple  $D_n$  modules over  $\mathbb{C}$ . You can use the code

```

n:=5;
CharacterTable(DihedralGroup(n))
    
```

$n = 4:$ <table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr><td colspan="6">-----</td></tr> <tr><td>Class</td><td> </td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td></tr> <tr><td>Size</td><td> </td><td>1</td><td>1</td><td>2</td><td>2</td><td>2</td></tr> <tr><td>Order</td><td> </td><td>1</td><td>2</td><td>2</td><td>2</td><td>4</td></tr> <tr><td colspan="6">-----</td></tr> <tr><td>p</td><td>=</td><td>2</td><td>1</td><td>1</td><td>1</td><td>1</td><td>2</td></tr> <tr><td colspan="6">-----</td></tr> <tr><td>X.1</td><td>+</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td></tr> <tr><td>X.2</td><td>+</td><td>1</td><td>1</td><td>-1</td><td>1</td><td>-1</td></tr> <tr><td>X.3</td><td>+</td><td>1</td><td>1</td><td>1</td><td>-1</td><td>-1</td></tr> <tr><td>X.4</td><td>+</td><td>1</td><td>1</td><td>-1</td><td>-1</td><td>1</td></tr> <tr><td>X.5</td><td>+</td><td>2</td><td>-2</td><td>0</td><td>0</td><td>0</td></tr> </table>	-----						Class		1	2	3	4	5	Size		1	1	2	2	2	Order		1	2	2	2	4	-----						p	=	2	1	1	1	1	2	-----						X.1	+	1	1	1	1	1	X.2	+	1	1	-1	1	-1	X.3	+	1	1	1	-1	-1	X.4	+	1	1	-1	-1	1	X.5	+	2	-2	0	0	0	,	$n = 5:$ <table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr><td colspan="5">-----</td></tr> <tr><td>Class</td><td> </td><td>1</td><td>2</td><td>3</td><td>4</td></tr> <tr><td>Size</td><td> </td><td>1</td><td>5</td><td>2</td><td>2</td></tr> <tr><td>Order</td><td> </td><td>1</td><td>2</td><td>5</td><td>5</td></tr> <tr><td colspan="5">-----</td></tr> <tr><td>p</td><td>=</td><td>2</td><td>1</td><td>1</td><td>4</td><td>3</td></tr> <tr><td>p</td><td>=</td><td>5</td><td>1</td><td>2</td><td>1</td><td>1</td></tr> <tr><td colspan="5">-----</td></tr> <tr><td>X.1</td><td>+</td><td>1</td><td>1</td><td>1</td><td>1</td></tr> <tr><td>X.2</td><td>+</td><td>1</td><td>-1</td><td>1</td><td>1</td></tr> <tr><td>X.3</td><td>+</td><td>2</td><td>0</td><td>Z1</td><td>Z1#2</td></tr> <tr><td>X.4</td><td>+</td><td>2</td><td>0</td><td>Z1#2</td><td>Z1</td></tr> </table>	-----					Class		1	2	3	4	Size		1	5	2	2	Order		1	2	5	5	-----					p	=	2	1	1	4	3	p	=	5	1	2	1	1	-----					X.1	+	1	1	1	1	X.2	+	1	-1	1	1	X.3	+	2	0	Z1	Z1#2	X.4	+	2	0	Z1#2	Z1

X.4	+	2	0	Z1#2	Z1																																																																																																																																																						

and vary  $n$ .

(b) Show that your guessed classification is true.

(c\*) What happens for general fields?

**Exercise 3 (Infinite fun with dihedral groups – à la KL).** Retain the notation from Exercise 2.

For an arbitrary field  $\mathbb{K}$  consider the group algebra  $S = \mathbb{K}[D_\infty]$  of the infinite dihedral group  $D_\infty = \langle 1, 2 | 1^2 = 2^2 = \emptyset \rangle$ . Every element of  $D_\infty$  has an unique reduced expression and we write  $k, 1, 2$  and  $k, 2, 1$  for the reduced expressions  $\dots 21$  and  $\dots 12$  in  $k$  symbols.

The algebra  $S$  has a KL basis  $\{b_w | w \in D_\infty\}$  (whose precise definition does not matter) with identity  $b_\emptyset$ . Set  $b_{0,a,b} = 0$ . The nonidentity multiplication rules are given by the Clebsch–Gordan formula:

$$b_{k,1,2}b_{j,1,2} = \begin{cases} 2b_{|k-j|+1,1,2} + \dots + 2b_{|k+j|-1,1,2} & j,1,2=2\dots 12, \\ b_{|k-j|,1,2} + 2b_{|k-j|+2,1,2} + \dots + 2b_{|k+j|-2,1,2} + b_{|k+j|,1,2} & j,1,2=1\dots 12. \end{cases}$$

There are also similar formulas with  $b_{j,2,1}$  on the right.

For example:

$$b_{1212}b_{21212} = 2b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212},$$

$$b_{1212}b_{121212} = b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212} + b_{1212121212}.$$

(a) Compute the cell structure of  $S$  with respect to the KL basis  $\{b_w | w \in D_\infty\}$  for  $\text{char}(\mathbb{K}) \neq 2$ . Skip the identification of the nontrivial  $S_{\mathcal{H}}$  for now.

(b') Compare the nontrivial  $S_{\mathcal{H}}$  of  $S$  to the Grothendieck algebra of complex finite dimensional  $\text{SO}_3(\mathbb{C})$ -representations.

(c) What happens in characteristic two?

**Exercise 4 (Finite fun with dihedral groups – à la KL).** Retain the notation from Exercise 3.

Let  $S = D_n = \langle 1, 2 | 1^2 = 2^2 = (12)^n = \emptyset \rangle$  be the dihedral group of the  $n$  gon. The longest element is  $w_0 = n, 1, 2 = n, 2, 1$ .

With respect to the KL basis and its multiplication rules, the only change compare to  $D_\infty$  is that expressions of the form (here  $d > 0$ )

$$b_{n-d,1,2} + b_{n+d,1,2} \mapsto 2b_{w_0}, \quad b_{n-d,2,1} + b_{n+d,2,1} \mapsto 2b_{w_0}.$$

are replaced as indicated. This is the truncated Clebsch–Gordan formula.

For example, for  $n = 6$  one gets:

$$b_{1212}b_{21212} = 2b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212} = 2b_{12} + 6b_{121212},$$

$$b_{1212}b_{121212} = b_{12} + 2b_{1212} + 2b_{121212} + 2b_{12121212} + b_{1212121212} = 8b_{121212}.$$

(a) Compute the cell structure of  $S$  with respect to the KL basis  $\{b_w | w \in D_n\}$  for  $\mathbb{K} = \mathbb{C}$  and odd  $n$ . Skip the identification of the nontrivial  $S_{\mathcal{H}}$  for now.

(b') In Exercise 3 we have seen that the representation theory of the infinite dihedral group for the middle cell is controlled by  $\text{SO}_3(\mathbb{C})$ . Show that the same is true in finite type when working with an appropriate semisimplification of  $\text{SO}_3(\mathbb{C})$ -representations.

(c\*) What are the nontrivial  $S_{\mathcal{H}}$  explicitly?

(d) What is the difference between odd and even  $n$ ?

(e\*) What happens over general fields?

- ▶ There might be typos on the exercise sheets, my bad. Be prepared.
- ▶ Star exercises are a bit trickier; prime exercises use notions I haven't explained.
- ▶ SageMath online calculator <https://sagecell.sagemath.org/> with the relevant material summarized on [https://doc.sagemath.org/html/en/thematic\\_tutorials/lie/weyl\\_character\\_ring.html](https://doc.sagemath.org/html/en/thematic_tutorials/lie/weyl_character_ring.html)
- ▶ Magma online calculator <http://magma.maths.usyd.edu.au/calc/>

**Hints for Exercise 2**

The one dimensional representations are easy to construct. For the two dimensional representations use

$$1 \mapsto \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}, \quad 2 \mapsto \begin{pmatrix} \cos(2\pi k/n) & -\sin(2\pi k/n) \\ -\sin(2\pi k/n) & -\cos(2\pi k/n) \end{pmatrix}.$$

Via easy calculations (seriously: these are 2x2 matrices!) one verifies: The matrices satisfy the relations of  $D_n$  and have no common eigenvector, so the associated representations are simple. They are also nonconjugate for  $k \in \{1, \dots, \lfloor \frac{n-1}{2} \rfloor\}$ . Finally, the sum of the squares of their dimensions is  $2n$ , so we are done.

In general,  $D_n \cong \mathbb{Z}/n\mathbb{Z} \rtimes \mathbb{Z}/2\mathbb{Z}$ , and one can use 12 and 1 as the generators of the two groups in this semidirect product. Now induce from those two groups and hope for the best.

**Hints for Exercise 3**

Unless the characteristic of  $\mathbb{K}$  is two, the picture should look like

$$\begin{array}{ccc} \mathcal{J}_m & \begin{array}{|c|c|} \hline b_1, b_{121}, \dots & b_{12}, b_{1212}, \dots \\ \hline b_{21}, b_{2121}, \dots & b_2, b_{212}, \dots \\ \hline \end{array} & S_{\mathcal{H}} \cong_s \mathbb{K}[\mathbb{Z}] \\ \mathcal{J}_\emptyset & \begin{array}{|c|} \hline b_\emptyset \\ \hline \end{array} & S_{\mathcal{H}} \cong \mathbb{K} \end{array}$$

The Grothendieck algebra (abelian or additive, that does not make a difference) of  $SO_3(\mathbb{C})$  can be computed via the SageMath online calculator, see above, with the code

```
A=WeylCharacterRing("A1",style="coroots");
k=5;
j=4;
A(2*k,0)*A(2*j,0)
```

You need to vary  $k$  and  $j$ , and identify  $b_{121}$  with  $A(2) = A(2, 0)$  up to scaling. Neither  $b_{121}$  nor  $A(2)$  satisfy any polynomial relation, but both generate the respective algebras.

**Hints for Exercise 4**

Unless the characteristic of  $\mathbb{K}$  is nonzero and small, the picture for  $n$  being odd should look like

$$\begin{array}{ccc} \mathcal{J}_{w_0} & \begin{array}{|c|} \hline b_{w_0} \\ \hline \end{array} & S_{\mathcal{H}} \cong \mathbb{K} \\ n \text{ odd: } \mathcal{J}_m & \begin{array}{|c|c|} \hline b_1, b_{121}, \dots & b_{12}, b_{1212}, \dots \\ \hline b_{21}, b_{2121}, \dots & b_2, b_{212}, \dots \\ \hline \end{array} & S_{\mathcal{H}} \cong_s \mathbb{K}[\mathbb{Z}/\frac{n-1}{2}\mathbb{Z}] \\ \mathcal{J}_\emptyset & \begin{array}{|c|} \hline b_\emptyset \\ \hline \end{array} & S_{\mathcal{H}} \cong \mathbb{K} \end{array}$$

That the diagonal  $S_{\mathcal{H}}$  have pseudo idempotents is clear by  $b_1 b_1 = 2b_1$ . For the off-diagonal elements let us take  $n = 7$  and  $b = b_{12} - b_{1212} + b_{121212}$ . Then the multiplication table

	$b_{12}$	$-b_{1212}$	$b_{121212}$
$b_{12}$	$2b_{12} + b_{1212}$	$-b_{12} - 2b_{1212} - b_{121212}$	$b_{1212} + b_{121212}$
$-b_{1212}$	$-b_{12} - 2b_{1212} - b_{121212}$	$2b_{12} + 2b_{1212} + b_{121212}$	$-b_{12} - b_{1212}$
$b_{121212}$	$b_{1212} + b_{121212}$	$-b_{12} - b_{1212}$	$b_{12}$

verifies that  $b^2 = b$ . The general case is similar. (Note that  $b$  would be an infinite alternating sum for  $n = \infty$ , and that is why the off-diagonal  $S_{\mathcal{H}}$  do not have pseudo idempotents in the infinite case.)

The isomorphism  $S_{\mathcal{H}} \cong_s \mathbb{K}[\mathbb{Z}/\frac{n-1}{2}\mathbb{Z}]$  for nonsilly  $\mathbb{K}$  can be verified as follows. Let  $U_k^3(X)$  be the (Chebyshev-like multiplication by quantum three) polynomial defined via  $U_0^3(X) = 1$ ,  $U_1^3(X) = X$  and

$$U_k^3(X) = (X - 1)U_{k-1}^3(X) - U_{k-2}^3(X).$$

This polynomial is the defining polynomial for  $\mathrm{SO}_3(\mathbb{C})$  in the sense that  $U_k^3(X)$  is the highest weight summand in the tensor product  $(X = \mathbb{C}^3)^{\otimes k}$ . Here is some SageMath code:

```
A=WeylCharacterRing("A1",style="coroots");
gen=A(2,0);
k=7;
def U(n,x):
if n == 0:
return 1
elif n == 1:
return x
else:
return (x-1) * U(n-1,x) - U(n-2,x)
print(U(k,gen))
```

Now  $U_m^3(b_{121}) = 0$  for  $m = \frac{n-1}{2}$ , so  $S_{\mathcal{H}} \cong_s \mathbb{K}[X]/(U_m^3(X))$ . Since  $U_m^3(X)$  has distinct roots, we can then rescale  $\mathbb{K}[X]/(U_m^3(X))$  to  $\mathbb{K}[X]/(X^m - 1) \cong \mathbb{K}[\mathbb{Z}/m\mathbb{Z}]$ .

That was the case of  $\mathrm{SO}_3(\mathbb{C})$ , so you need to argue why this implies the same for the KL basis of the finite dihedral group.
