

LECTURE MATH4311: ALGEBRAIC TOPOLOGY

Disclaimer

Nobody is perfect, and I might have written or said something silly. If there is any doubt, then please check the references or contact me. All questions welcome!

What?

Algebraic topology is a twentieth century field of mathematics that is pervasive across mathematics and the sciences. It is unreasonably successful, being one of the newest fields of mathematics.

One of the most important aims of algebraic topology is to distinguish or classify topological spaces and maps between them up to homeomorphism.

Invariants (data that stays the same under operations on spaces) and obstructions are key to achieve this aim, meaning that

$$\text{invariants different} \Rightarrow \text{spaces different.}$$

The converse is however often false, and invariants are stronger the more often the converse holds. However, strong invariants might be hard or impossible to compute, and a good invariant is an invariant which balances between being strong and computable. The main aim of algebraic topology is to associate algebraic data to topological spaces.

Here is an example. The sphere and the torus illustrated below are certainly not the same. But how can we be sure? The algebraic topology approach is to associate to them, say, numbers χ

$$\chi \left(\text{red balloon} \right) = 2 \neq 0 = \chi \left(\text{blue torus} \right),$$

so we conclude that the sphere (left, a balloon) is not the torus (right, an empty donut) by simply observing that $2 \neq 0$. However, the invariant χ is not complete in the sense that

$$\chi \left(\text{purple disc} \right) = 1 = \chi \left(\text{knotted sphere} \right),$$

but the two topological spaces, the disc and the real projective plane (right, immersed in \mathbb{R}^3), are not the same. A crucial aim of algebraic topology is thus to have a big enough backpack of invariants to tackle problems in the wild.

A classical and familiar invariant is the Euler characteristic of a topological space (used in the above examples), which was initially discovered via combinatorial methods and has been rediscovered in many different guises. This invariant associates numbers to topological spaces, and is without doubt a good invariant.

Modern algebraic topology goes one step further, and associates more sophisticated invariants to topological spaces. Algebraic topology allows the solution of complicated geometric problems with algebraic methods.

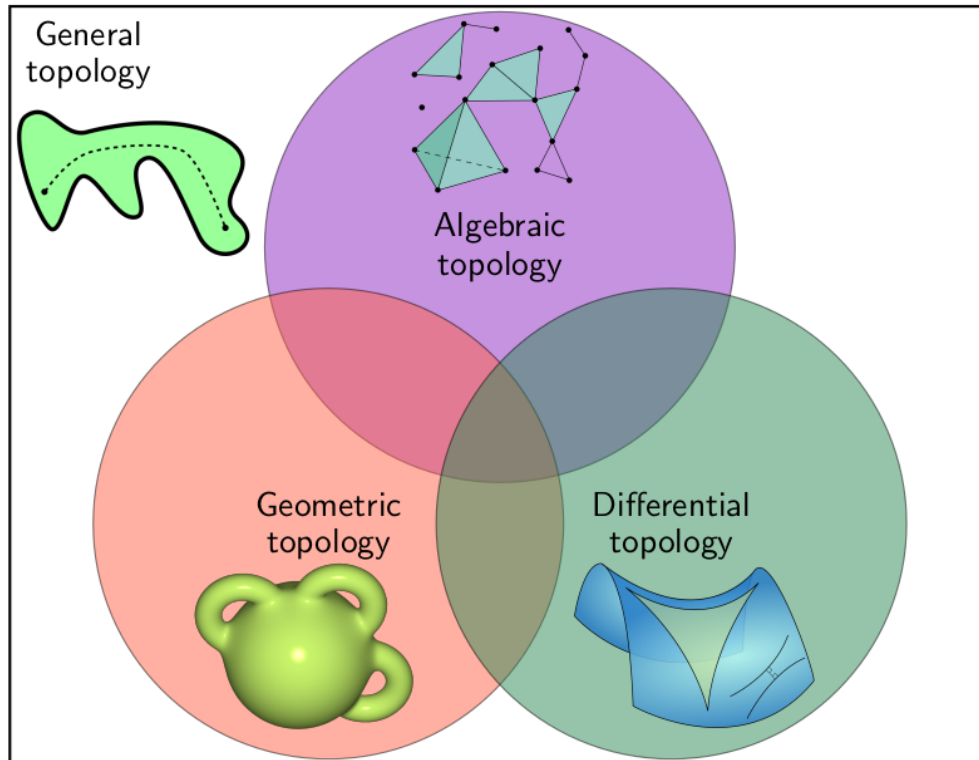

In a nutshell, imagine a closed loop of string that looks knotted in space. How would you tell if you can wiggle it about to form an unknotted loop without cutting the string? The space of all deformations of the loop is an intractable set. The key idea is to associate algebraic structures, such as groups or vector spaces, with topological objects such as knots, in such a way that complicated topological questions can be phrased as simpler questions about the algebraic structures. In particular,

this turns questions about an intractable set into a conceptual or finite, computational framework that allows us to answer these questions with certainty.

In this unit you will learn about fundamental group and covering spaces, homology and cohomology theory. These form the basis for applications in other domains within mathematics and other disciplines, such as physics or biology. In fact, one of the strengths of algebraic topology has always been its wide degree of applicability to other fields.

At the end we will have developed skills to determine whether seemingly intractable problems can be solved with topological methods.

As a final note, there are three main fields of modern topology, with a huge overlap, of course. These fields are algebraic, geometric and differential topology:

All of these are similar in flavor and have the same aims, but use different methods. All of this is embedded into general topology, which provides the underlying language.

The lecture follows [Ha02] (freely available), other always useful textbooks include [StSe78] (general topology), [Tu11] (geometric topology), [Wa68] (differential topology), and many more! Using google and YouTube is also helpful. If you are unfamiliar with the basic ideas of general topology try [Mo20] (freely available), or have a look at the discussion on math.stackexchange.com/questions/7520.

Who?

Fourth semester students in Mathematics interested in a mixture of (linear) algebra, topology and category theory, but everyone is welcome.

Where and when?

- ▶ Time and date for the lecture.
 - ▷ Every Monday from 12:00–14:00.
 - ▷ Online, zoom links can be found on Canvas. Alternatively use 82018001516
 - ▷ First lecture: Monday 01.Aug.2021. Last lecture: Monday 01.Nov.2021.
- ▶ Time and date for the tutorials.
 - ▷ Every Friday from 12:00–14:00.
 - ▷ Online, zoom links can be found on Canvas. Alternatively use 81580288984
 - ▷ First tutorial: Friday 13.Aug.2021. Last tutorial: Friday 05.Nov.2021.

Material for the lecture

- ▶ Main source [Ha02].
- ▶ MATH4311 in Canvas.
- ▶ My website www.dtubbenhauer.com/lecture-algtop-2021.html
- ▶ Website www.maths.usyd.edu.au/u/UG/HM/MATH4311/
- ▶ Prerecorded lectures on the “What is...algebraic topology?” playlist here: www.youtube.com/c/VisualMath/playlists
- ▶ Exercise sheets are available on Canvas or on the course website.

Assessments

- ▶ Assignment 1 (25%), due 23:59 17.Sep.2021.
- ▶ Assignment 2 (25%), due 23:59 05.Nov.2021.
- ▶ Exam (50%), 24.Nov.2021, start 9:00. For more details see www.dtubbenhauer.com/lecture-algtop-2021.html.

Schedule and some details.

1. The beginnings – What is...algebraic topology?
 - ▶ **Speaker and date.** Daniel Tubbenhauer, 09.Aug.2021, 12:00–14:00.
 - ▶ **Plan.** After some organizational preliminaries are addressed, this talk will be a collection of motivating example, none of which will be explained in a formal matter, but rather in an intuitive way.
 - ▶ **YouTube.** Video 1 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** This talk is not following any explicit literature, but is rather an overview of what will follow.

2. Some definitions in topology – Cell complexes and alike.
 - ▶ **Speaker and date.** Daniel Tubbenhauer, 16.Aug.2021, 12:00–14:00.
 - ▶ **Plan.** This talk starts by briefly recalling some basic notions in general topology including one of the two fundamental equivalences of algebraic topology: homeomorphisms. Then we will discuss homotopy, the second main equivalence in algebraic topology. Finally, the main players of algebraic topology: cell complex can some of their properties.
 - ▶ **YouTube.** Videos 2, 3 and 4 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Chapter 0].

3. The fundamental group I – The first steps.
 - ▶ **Speaker and date.** Daniel Tubbenhauer, 23.Aug.2021, 12:00–14:00.
 - ▶ **Plan.** The fundamental group is in some sense the easiest invariant algebraic topology has to offer in the sense that it is quickly digested and yet powerful. This talk will explain the basic ideas regarding the fundamental group.
 - ▶ **YouTube.** Video 5 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Section 1.1].

4. The fundamental group II – The Seifert–van Kampen theorem.

- ▶ **Speaker and date.** Daniel Tubbenhauer, 30.Aug.2021, 12:00–14:00.
 - ▶ **Plan.** The fundamental group can be computed by a cut-paste procedure which is the Seifert–van Kampen theorem. In this talk we will explain named theorem and we discuss several examples.
 - ▶ **YouTube.** Video 6 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Section 1.2].
5. The fundamental group III – Covering spaces.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 06.Sep.2021, 12:00–14:00.
 - ▶ **Plan.** The fundamental group satisfies a Galois correspondence where on the algebraic side one sees subgroups, while on the topological side covering spaces appear. This talk will explain this correspondence as well as the notions involved in it.
 - ▶ **YouTube.** Videos 7 and 8 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Section 1.3].
6. The fundamental group IV – Groups, graphs and $K(G, 1)$ spaces.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 13.Sep.2021, 12:00–14:00.
 - ▶ **Plan.** Wrapping up the first part of this lecture on the fundamental group, this talk will explain how groups and coverings are closely related.
 - ▶ **YouTube.** Videos 9 and 10 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Sections 1.1.A and 1.1.B].
7. Homology and cohomology I – Simplicial, singular and cellular homology.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 20.Sep.2021, 12:00–14:00.
 - ▶ **Plan.** Homology (or cohomology) is an invariant which is a bit trickier to explain compared to the fundamental group, but arguably the most important notion algebraic topology has to offer. This talk is meant as a lightning introduction to homology. (This lecture spends more time on cohomology, which is almost the same, but slightly better.)
 - ▶ **YouTube.** Videos 11, 12, 13, 14, 15 and 17 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Sections 2.1 and 2.2].
8. Homology and cohomology II – The axiomatic approach.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 04.Oct.2021, 12:00–14:00.
 - ▶ **Plan.** Category theory originally arose from (co)homology theory, because these theories are prototypical examples of functors. The aim of this talk is to explain homology category-theoretical. This formulation can also be used for cohomology.
 - ▶ **YouTube.** Videos 18, 19 and 20 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Section 2.3].
9. Homology and cohomology III – Cohomology groups.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 11.Oct.2021, 12:00–14:00.
 - ▶ **Plan.** Cohomology is the dual of homology, but has some additional properties which makes it slightly nicer than homology. In this talk we will explain the definition and some first properties.

- ▶ **YouTube.** Videos 16, 21 and 22 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Section 3.1].
10. Homology and cohomology IV – The cohomology ring.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 18.Oct.2021, 12:00–14:00.
 - ▶ **Plan.** What makes the cohomology slightly nicer than the homology is that it naturally comes with a multiplication, *i.e.* cohomology forms a ring. (In contrast, homology forms a coring which is a bit trickier to get your head around.) This talk will explain this in details.
 - ▶ **YouTube.** Videos 23 and 24 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Section 3.2].
11. Homology and cohomology V – Poincaré duality.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 25.Oct.2021, 12:00–14:00.
 - ▶ **Plan.** In this talk we explain a certain, very powerful, duality relating homology and cohomology in nice cases.
 - ▶ **YouTube.** Videos 25, 26, 27 and 28 on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Section 3.3].
12. Whats next? – Some outlook including homotopy.
- ▶ **Speaker and date.** Daniel Tubbenhauer, 01.Nov.2021, 12:00–14:00.
 - ▶ **Plan.** As a conclusion of the lecture, this talk will explain what potential further directions algebraic topology has to offer. An example is the (notoriously hard to compute) homotopy group, a higher dimensional version of the fundamental group.
 - ▶ **YouTube.** Videos 29+ on the “What is algebraic topology?” playlist.
 - ▶ **Literature.** [Ha02, Chapter 4] and other material.
