

What is...quantum topology - part 7?

Or: Categories 5 from Chapter 1

Feynman diagrams

I stole this picture from Wikipedi, page Feynman diagrams

- ▶ A diagrammatic calculus for computing amplitudes in QFT
- ▶ Lines represent particles; vertices represent interactions Typing
- ▶ Composition is by gluing: integrals over intermediate states Composition

Penrose graphical notation

$$\begin{aligned} & \text{covariant derivative } 12 \nabla_a \left(\xi^f \lambda_{fb[c}^{(d} D_{gh]}^{e)b} \right) \\ &= 12 \left(\xi^f (\nabla_a \lambda_{fb[c}^{(d} D_{gh]}^{e)b} + (\nabla_a \xi^f) \lambda_{fb[c}^{(d} D_{gh]}^{e)b} + \xi^f \lambda_{fb[c}^{(d} (\nabla_a D_{gh]}^{e)b} \right) \end{aligned}$$

I stole this picture from Wikipedi, page Penrose notation

- ▶ A diagrammatic calculus for multilinear algebra
- ▶ Wires represent tensor indices; boxes represent tensors Typing
- ▶ Composition is tensor contraction via connected wires Composition

String diagrams

Duality between commutative diagrams (on the left hand side) and string diagrams (on the right hand side)

I stole this picture from Wikipedia, page String diagrams

- ▶ A diagrammatic calculus for monoidal categories
- ▶ Wires are objects; nodes are morphisms **Typing**
- ▶ Composition is vertical (and later horizontal) stacking **Composition**

For completeness: A formal definition

1D. Feynman diagrams. We now discuss a convenient notation for categories, sometimes called *Feynman* (or *Penrose* or *string* or...) *diagrams*, but we will also say e.g. *diagrammatics*.

Given a category $\mathbf{C}$, we will denote objects $X \in \mathbf{C}$ and morphisms $f \in \mathbf{C}$ as

$$(1D-1) \quad X \rightsquigarrow \begin{array}{c} X \\ \uparrow \\ X \end{array} \left(= X \uparrow \right), \quad f \rightsquigarrow \begin{array}{c} Y \\ \uparrow \\ \boxed{f} \\ \uparrow \\ X \end{array}, \quad \text{id}_X \rightsquigarrow \begin{array}{c} X \\ \uparrow \\ \boxed{\text{id}_X} \\ \uparrow \\ X \end{array} = \begin{array}{c} X \\ \uparrow \\ \boxed{\text{id}_X} \\ \uparrow \\ X \end{array}.$$

From now on, we use the convention from [Convention 1A.3](#), meaning that we omit the orientations.

Remark 1D.2. This notation is “Poincaré dual” to the one $f: X \rightarrow Y$ since, in diagrammatic notation, objects are strands and morphisms points, illustrated as coupons; see (1D-1). $\diamond$

The composition is horizontal stacking, i.e.

$$(1D-3) \quad \begin{array}{c} A \\ | \\ \boxed{h} \\ | \\ Z \end{array} \circ \left(\begin{array}{c} Z \\ | \\ \boxed{g} \\ | \\ Y \end{array} \circ \begin{array}{c} Y \\ | \\ \boxed{f} \\ | \\ X \end{array} \right) = \begin{array}{c} A \\ | \\ \boxed{h} \\ | \\ Z \\ | \\ \boxed{g} \\ | \\ Y \\ | \\ \boxed{f} \\ | \\ X \end{array} = \left(\begin{array}{c} A \\ | \\ \boxed{h} \\ | \\ Z \end{array} \circ \begin{array}{c} Z \\ | \\ \boxed{g} \\ | \\ Y \end{array} \right) \circ \begin{array}{c} Y \\ | \\ \boxed{f} \\ | \\ X \end{array}.$$

The formal rule of manipulation of these diagrams is:

$$(1D-4) \quad \text{“Two diagrams are equivalent if they are related by scaling.”}$$

The following is (almost) immediate.

Theorem 1D.5. *The graphical calculus is consistent; i.e. two morphisms are equal if and only if their diagrams are related by (1D-4).*

String diagrams in QT

- Above With more structure at hand, string diagrams get very powerful
- At the moment they are rather one dimensional

Thank you for your attention!

I hope that was of some help.
