

# Examples of analytic methods in tensor categories

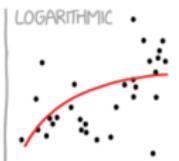

Or: Assume  $n$  is very large

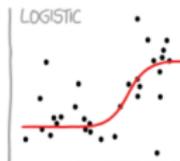

"HEY, I DID A REGRESSION!"

"I WANTED A CURVED LINE, SO I MADE ONE WITH MATH!"

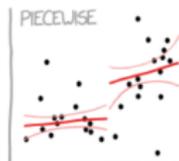

"LOOK, IT'S TAPERING OFF!"

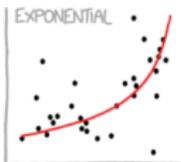

"I NEED TO CONNECT THESE TWO LINES, BUT MY FIRST IDEA DIDN'T HAVE ENOUGH MATH!"

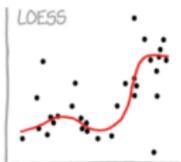

"LISTEN, SCIENCE IS HARD. BUT I'M A SERIOUS PERSON DOING MY BEST!"

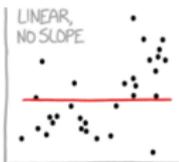

"I HAVE A THEORY, AND THIS IS THE ONLY DATA I COULD FIND."

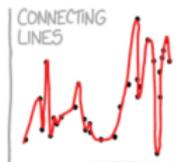

"LOOK, IT'S GROWING UNCONTROLLABLY!"

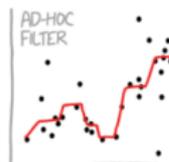

"I'M SOPHISTICATED, NOT LIKE THOSE BUMBLING POLYNOMIAL PEOPLE!"

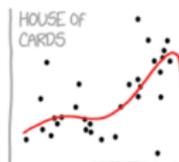

"I'M MAKING A SCATTER PLOT BUT I DON'T WANT TO."

"I CLICKED 'SMOOTH LINES' IN EXCEL."

"I HAD AN IDEA FOR HOW TO CLEAN UP THE DATA. WHAT DO YOU THINK?"

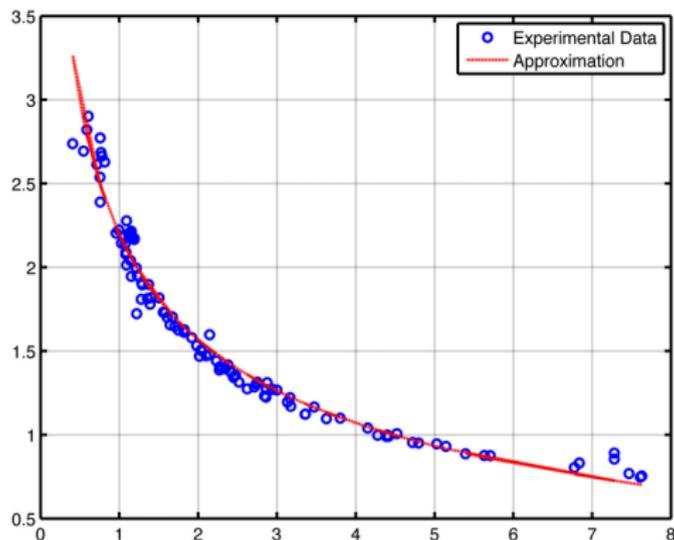

"AS YOU CAN SEE, THIS MODEL SMOOTHLY FITS THE- WAIT NO NO DON'T EXTEND IT AAAAAA!!!"

I report on work of Kevin Coulembier, Pavel Etingof and Victor Ostrik

April 2023

## Let us not count!

- ▶ **Observation** Many problems are only difficult because we like exact solutions
- ▶ **Bonus observation** Many difficult problems are easy for large subclasses
- ▶ **Analytic method (Folklore  $\sim$ very early)** Approximate answers are often much easier to get

If you do not know what this means in general  
you are in good **some** company: I do not know either!

We go by examples!

**Example/appetizer 1** from number theory – historically the first of its kind!?

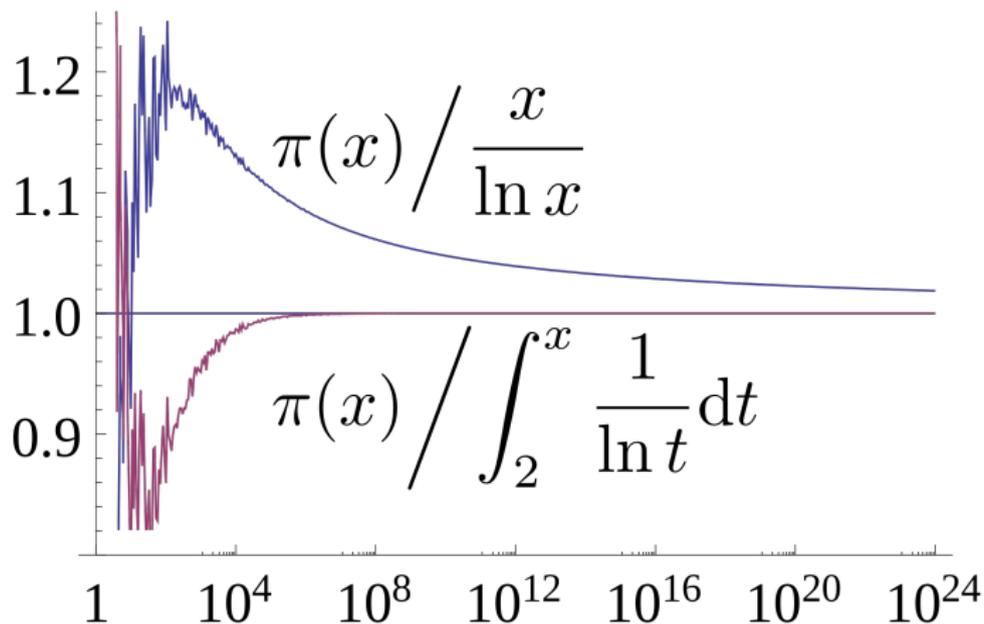

**Example/appetizer 2** from graph theory – easy to understand and prototypical

**Example 3** from representation theory – prototypical

**Example 4** from tensor categories – finally there

Analytic method (Ponikore – very early) Approximate answers are often  
much easier to get

## Let us not count!

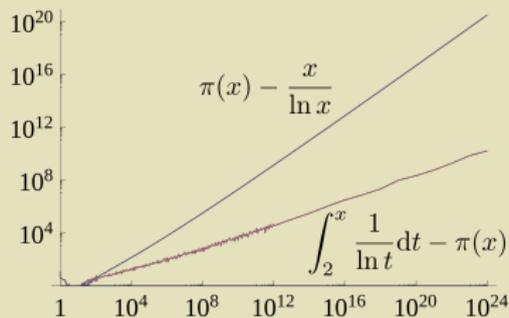

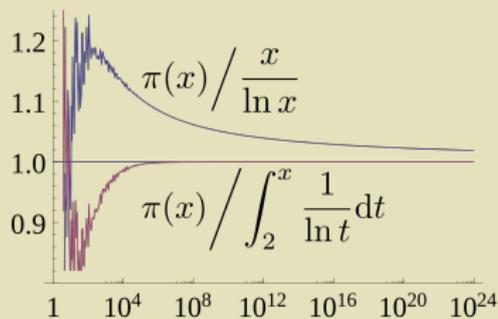

► Counting primes is **difficult** but...

► **Prime number theorem (many people ~1793)** #primes =  $\pi(n) \sim n / \ln n$

Let us ...

$\sim$  means asymptotically = **ratios** are good (not the absolute difference!)

So this is **not** doing the count!

► Prime number theorem (many people  $\sim 1793$ )  $\# \text{primes} = \pi(n) \sim n / \ln n$

Seriously, counting is difficult!

Legendre  $\sim 1808$ :  
(for  $n/(\ln n - 1.08366)$ )

Limite $x$	Nombre $\gamma$		Limite $x$	Nombre $\gamma$	
	par la formule.	par les Tables.		par la formule.	par les Tables.
10000	1250	1250	100000	9588	9592
20000	2268	2263	150000	13844	13849
30000	3252	3246	200000	17982	17984
40000	4205	4204	250000	22035	22045
50000	5136	5134	300000	26023	25998
60000	6049	6058	350000	29961	29977
70000	6949	6936	400000	33854	33861
80000	7838	7837			
90000	8717	8713			

Acctually, #primes < 1000 = 1229...

Gauss, Legendre and company counted primes up to  $n = 400000$  and more

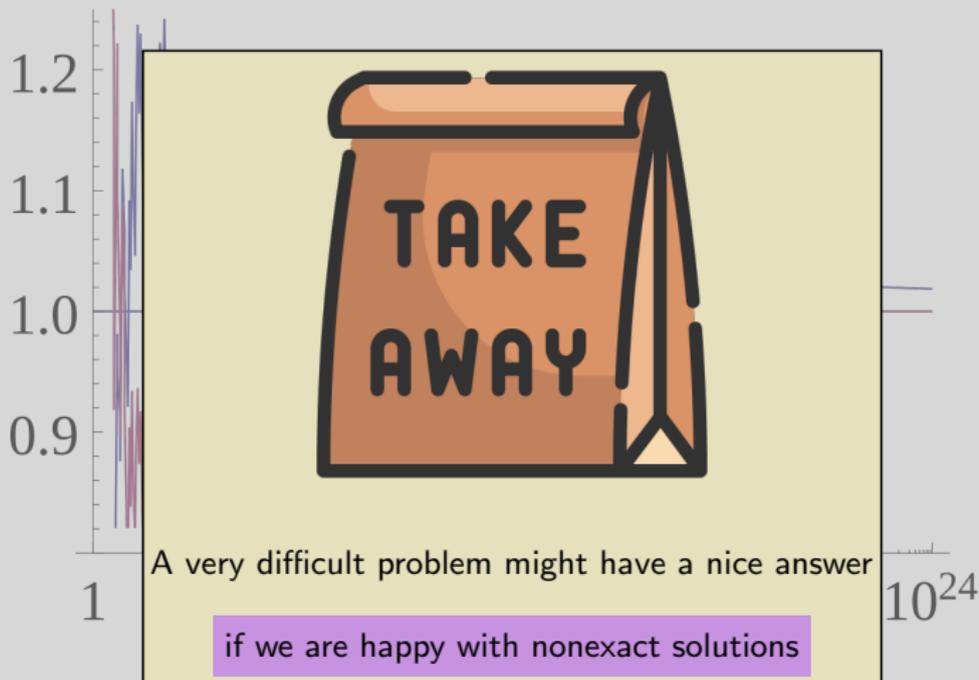

That took years (your iPhone can do that in seconds...humans have advanced!)

The prime number theorem gave birth to analytic number theory

Analytic number theory is full of  
“discrete statements solved approximately”

► Prime number theorem (many people  $\sim 1793$ )  $\#primes = \pi(n) \sim n/\ln n$

## Let us not count!

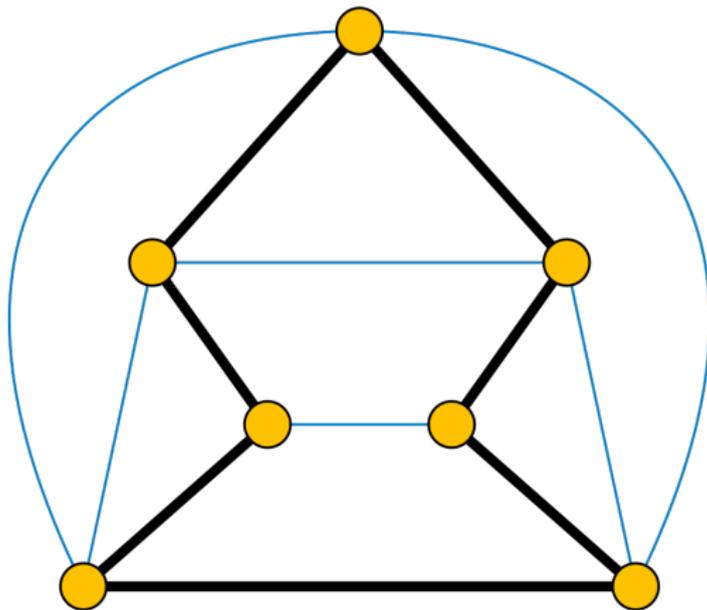

► Counting primes is difficult but...

► Prime number theorem (many people ~1793)  $\# \text{primes} = \pi(n) \sim n / \ln n$

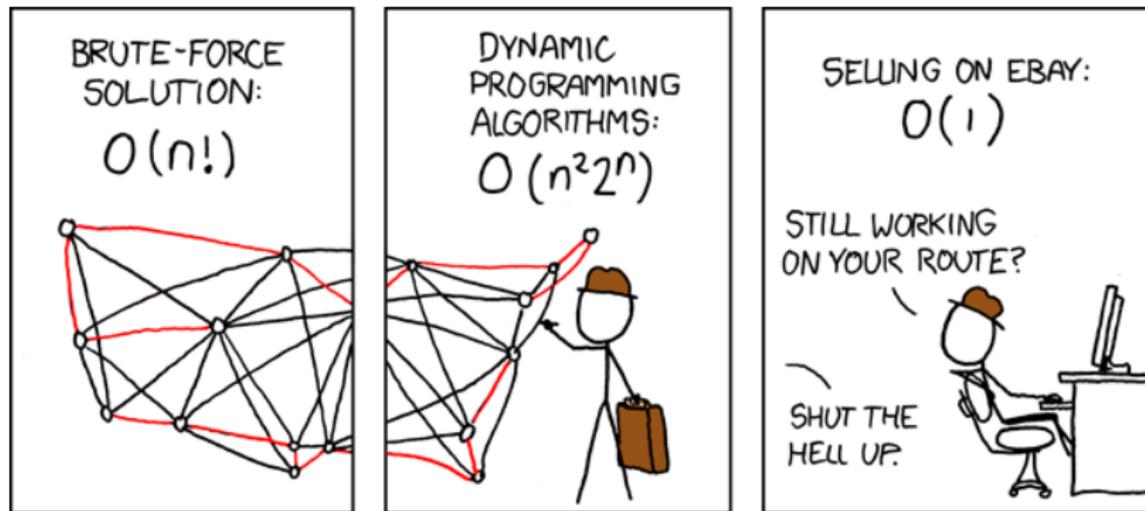

## Let us not count!

---

- 
- ▶ **Hamiltonian cycle** = a cycle that visits every vertex exactly once
  - ▶ **Hamiltonian graph** = a graph with an Hamiltonian cycle

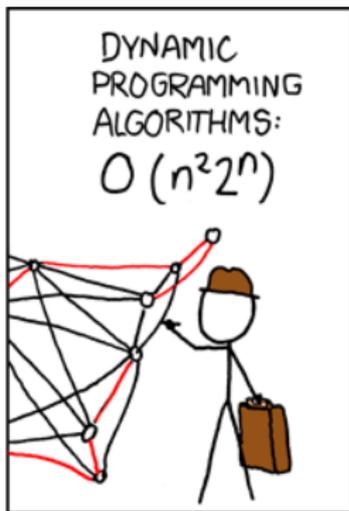

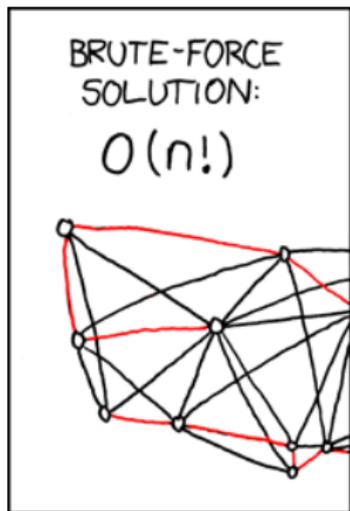

## Let us not count!

(This is the traveling salesperson problem.)

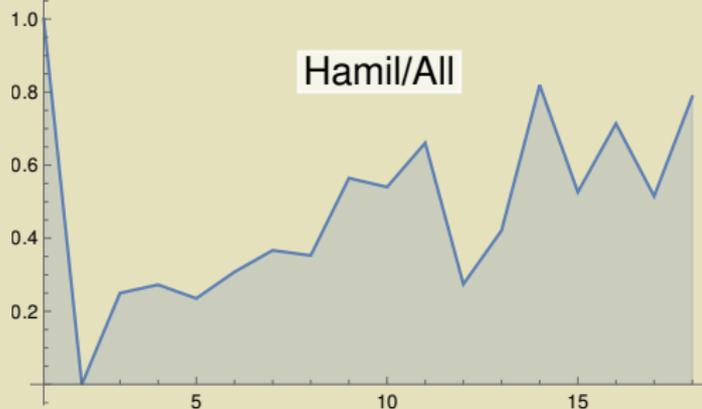

- ▶ Hamiltonian graph was one of the first problems shown to be NP-complete
- ▶ NP-complete “=” can't do much better than brute force
- ▶ Dynamic programming algorithms solves this is roughly in  $O(n^2 2^n)$ ,  $n = \#V$

## Let us not count!

- ▶ To determine **precisely** whether a graph is Hamiltonian is difficult
- ▶ To determine **approximately** whether a graph is Hamiltonian is easy
- ▶ **Pósa~1976** Choosing a graph randomly, the **probability is 1** that the graph is Hamiltonian:  $\lim_{n \rightarrow \infty} P(\text{Hamil}) = 1$  (probability)

Let us

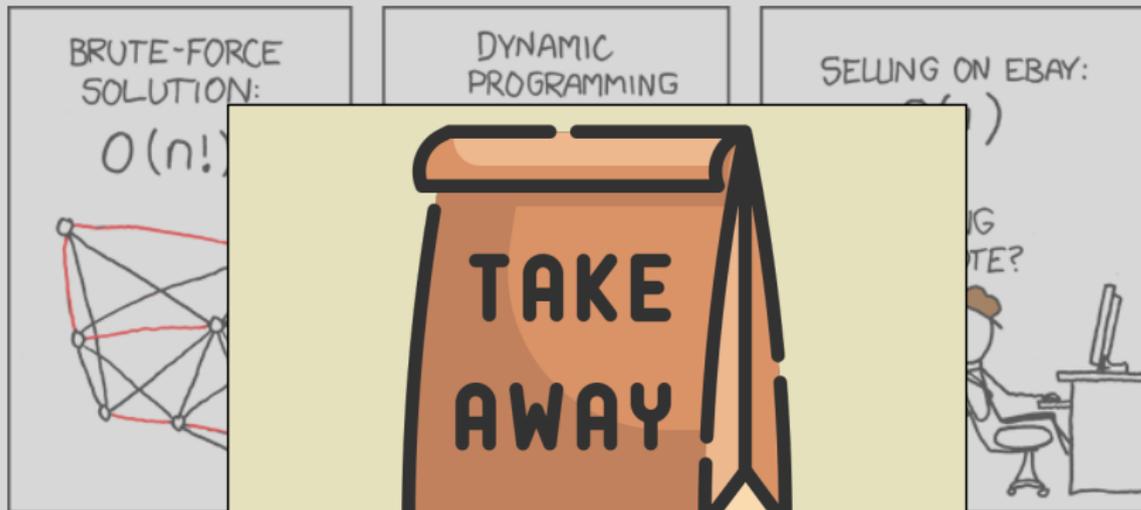

### The precise statement

Pósa showed that  $P(\text{Hamil}) \rightarrow 1$  for  $n \rightarrow \infty$  and graphs with  $cn \ln n$  edges  
This implies  $\frac{\#\text{HamilGraphs on } \leq n \text{ vertices}}{\#\text{AllGraphs on } \leq n \text{ vertices}}$   
goes to zero for  $n \rightarrow \infty$  since most graphs have  $\geq c'n^2$  edges

The proof of this theorem  
is a not difficult counting argument

In general, graph theory  
provides many statements of the form  
"XYZ is very difficult, but we can solve it approximately"

## Let us not count!

A very difficult problem might have a nice answer

almost all of the time

- ▶ To determine if a graph is Hamiltonian is difficult
- ▶ To determine if a graph is Hamiltonian is easy
- ▶ **Pósa ~ 1976** Choosing a graph randomly, the probability is 1 that the graph is Hamiltonian:  $\lim_{n \rightarrow \infty} P(\text{Hamil}) = 1$  (probability)

Slogan This is a very general setting

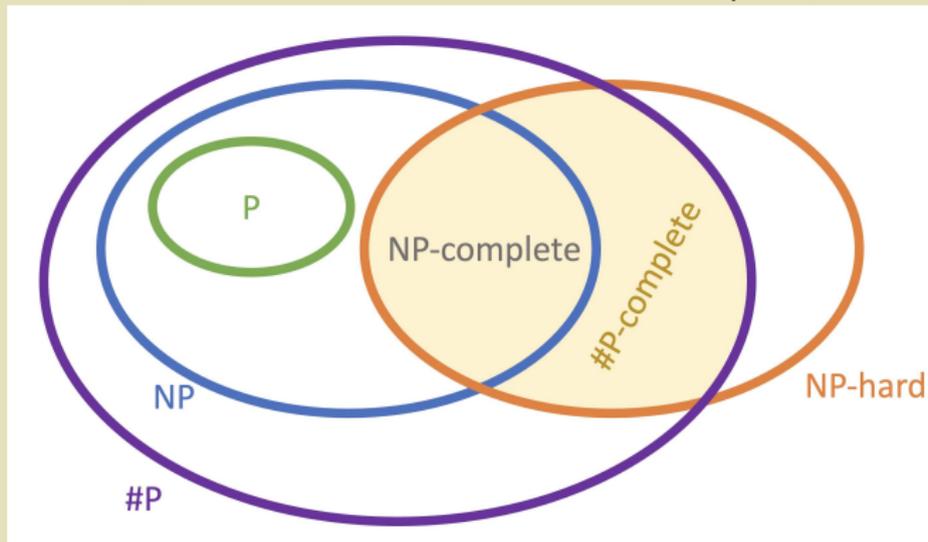

What ab

A problem we have seen before :

**Murnaghan ~1938** Asked to decompose  $V^{\otimes n}$  over  $\mathbb{C}$   
for  $S_n$  and  $V$  simple (Kronecker coefficients)

**Hepler ~1994 (potentially known earlier)**

Computing Kronecker coefficients is #P complete (=very difficult)

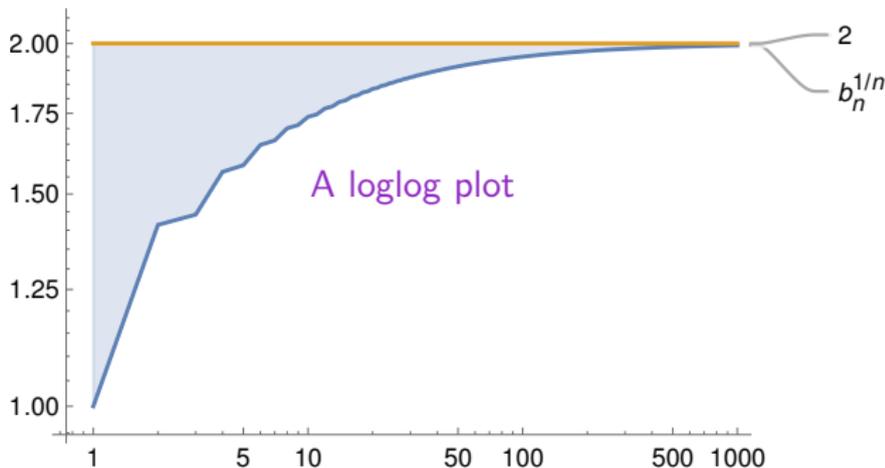

This is a very special case of what CEO want to do...

- ▶  $\Gamma = a$
- ▶  $\Gamma$  has
- ▶ Prob

$\Gamma$ -rep

## What about representation theory?

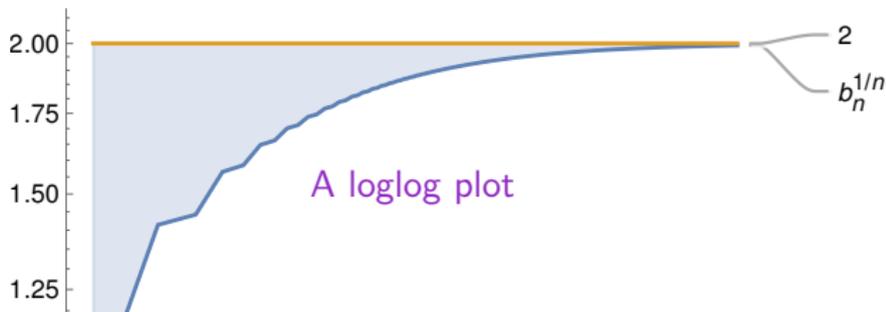

- ▶  $b_n = b_n^{\Gamma, V}$  = number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)
- ▶ **Example**  $\Gamma = SL_2$ ,  $\mathbb{K} = \mathbb{C}$ ,  $V = \mathbb{C}^2$ , then

$$\{1, 1, 2, 3, 6, 10, 20, 35, 70, 126, 252\}, \quad b_n \text{ for } n = 0, \dots, 10.$$

$$\lim_{n \rightarrow \infty} \sqrt[n]{b_n} \text{ seems to converge to } 2 = \dim V: \quad \sqrt[1000]{b_{1000}} \approx 1.99265$$

## What about representation theory?

Simplify the problem :

(a) Consider only the multiplicities instead of decompositions

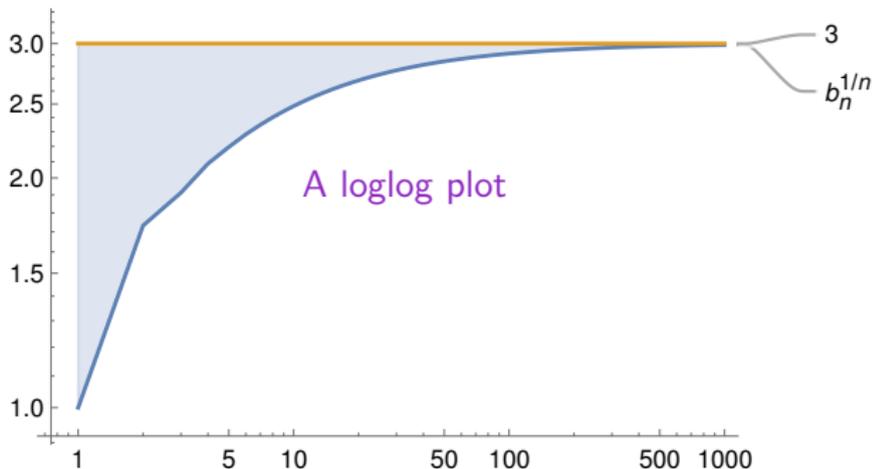

(b) Assume that  $n$  is very large

- ▶  $b_n = b_n^{\Gamma, V}$  = number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)
- ▶ **Example**  $\Gamma = SL_2$ ,  $\mathbb{K} = \mathbb{C}$ ,  $V = \mathbb{C}^2$ , then

$$\{1, 1, 2, 3, 6, 10, 20, 35, 70, 126, 252\}, \quad b_n \text{ for } n = 0, \dots, 10.$$

$$\lim_{n \rightarrow \infty} \sqrt[n]{b_n} \text{ seems to converge to } 2 = \dim V: \quad \sqrt[1000]{b_{1000}} \approx 1.99265$$

## What about representation theory?

- ▶  $b_n = b_n^{\Gamma, V}$  = number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)
- ▶ **Example**  $\Gamma = SL_2$ ,  $\mathbb{K} = \mathbb{C}$ ,  $V = \text{Sym } \mathbb{C}^2$ , then

$$\{1, 1, 3, 7, 19, 51, 141, 393, 1107, 3139, 8953\}, \quad b_n \text{ for } n = 0, \dots, 10.$$

$$\lim_{n \rightarrow \infty} b_n \text{ seems to converge to } 3 = \dim V: \quad \sqrt[1000]{b_{1000}} \approx 2.9875$$

## Observation 1

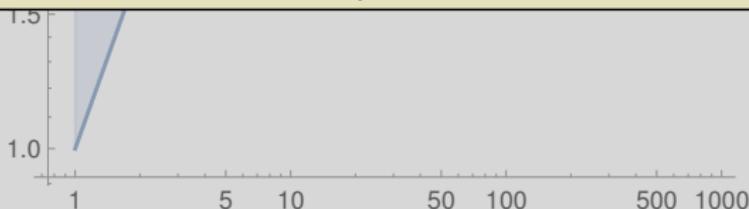

Whatever is true for  $SL_2$  over  $\mathbb{C}$  is true in general, right?

So let us come back to the general setting:

$\Gamma$  = affine semigroup superscheme

$\mathbb{K}$  = any field,  $V$  = any fin dim  $\Gamma$ -rep

$b_n = b_n^{\Gamma, V}$  = number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)

- ▶  $b_n = b_n^{\Gamma, V}$  = number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)
- ▶ **Example**  $\Gamma = SL_2$ ,  $\mathbb{K} = \mathbb{C}$ ,  $V = \text{Sym } \mathbb{C}^2$ , then

$\{1, 1, 3, 7, 19, 51, 141, 393, 1107, 3139, 8953\}$ ,  $b_n$  for  $n = 0, \dots, 10$ .

$\lim_{n \rightarrow \infty} b_n$  seems to converge to  $3 = \dim V$ :  $\sqrt[1000]{b_{1000}} \approx 2.9875$

## Observation 1

Whatever is true for  $SL_2$  over  $\mathbb{C}$  is true in general, right?

So let us come back to the general setting:

$\Gamma$  = affine semigroup superscheme

$\mathbb{K}$  = any field,  $V$  = any fin dim  $\Gamma$ -rep

$b_n = b_n^{\Gamma, V}$  = number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)

## Observation 2

$$b_n b_m \leq b_{n+m} \Rightarrow$$

$$\beta = \lim_{n \rightarrow \infty} \sqrt[n]{b_n}$$

is well-defined by a version of Fekete's Subadditive Lemma

- ▶  $b_n = b_n^{\Gamma, V}$  = number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)
- ▶ **Example**  $\Gamma = SL_2$ ,  $\mathbb{K} = \mathbb{C}$ ,  $V = \text{Sym } \mathbb{C}^2$ , then

$$\{1, 1, 3, 7, 19, 51, 141, 393, 1107, 3139, 8953\}, \quad b_n \text{ for } n = 0, \dots, 10.$$

$\lim_{n \rightarrow \infty} b_n$  seems to converge to  $3 = \dim V$ :  $\sqrt[1000]{b_{1000}} \approx 2.9875$

**Observation 1**

Whatever is true for  $SL_2$  over  $\mathbb{C}$  is true in general, right?

So let us come back to the general setting:

$\Gamma =$  affine semigroup superscheme

$\mathbb{K} =$  any field,  $V =$  any fin dim  $\Gamma$ -rep

$b_n = b_n^{\Gamma, V} =$  number of indecomposable summands of  $V^{\otimes n}$  (with multiplicities)

**Observation 2**

$$b_n b_m \leq b_{n+m} \Rightarrow$$

$$\beta = \lim_{n \rightarrow \infty} \sqrt[n]{b_n}$$

is well-defined by a version of Fekete's Subadditive Lemma

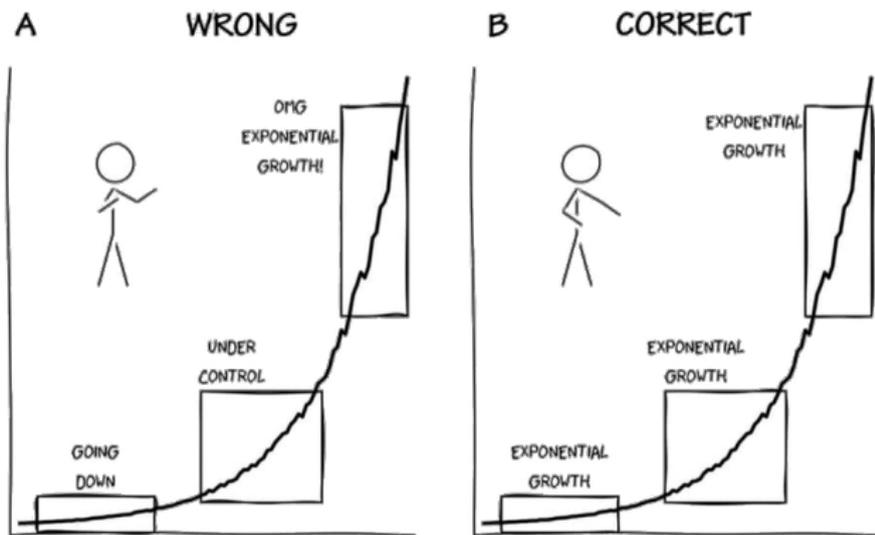

**Observation 3**

$$1 \leq \beta \leq \dim V$$

$$\beta = 1 \Leftrightarrow V^{\otimes n} \text{ for } n \gg 0 \text{ is 'one block'}$$

$$\beta = \dim V \Leftrightarrow \text{summands of } V^{\otimes n} \text{ for } n \gg 0 \text{ are 'essentially one-dimensional'}$$

# What about representation theory?

Coulembier–Etingof–Ostrik ~2023 We have

$$\beta = \lim_{n \rightarrow \infty} \sqrt[n]{b_n} = \dim V$$

Exponential growth is scary

In other words, compared to the size of the exponential growth of  $(\dim V)^n$  all indecomposable summands are 'essentially one-dimensional'

Sun

$(\dim V)^n$

summands- $\rightarrow$

Jupiter

Earth

Pluto

## What about representation theory?

### Honorable mentions

**Coulembier–Etingof–Ostrik ~2023** The same holds for any  $\mathbb{K}$ -linear Karoubian monoidal category that is Krull–Schmidt and has a  $\mathbb{K}$ -linear faithful symmetric monoidal functor to  $\mathbb{K}$ -vector spaces

### Coulembier–Etingof–Ostrik ~2023

Ditto in char zero when we go to super  $\mathbb{K}$ -vector spaces

**Coulembier–Etingof–Ostrik ~2022** Assume that our category has duals. If one only counts summands whose dim is divisible by some fixed prime then the limit is an algebraic integer in  $[1, \dim V]$

### Coulembier–Etingof–Ostrik ~2023

Many more results!

**Coulembier–Etingof–Ostrik ~2023** We have

$$\beta = \lim_{n \rightarrow \infty} \sqrt[n]{b_n} = \dim V$$

## What about representation theory?

A                      WRONG                      B                      CORRECT

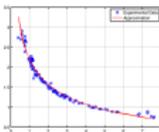

A very difficult problem might have a nice answer

if we are happy with nonexact solutions – similarly to the prime number theorem

$$\beta = \lim_{n \rightarrow \infty} \sqrt[n]{b_n} = \dim V$$

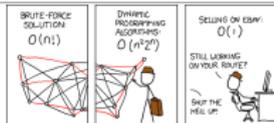

Let us not count!

- **Observation** Many problems are only difficult because we like exact solutions
- **Bonus observation** Many difficult problems are easy for large subcases
- **Analytic method (Fukukae - very early)** Approximate answers are often much easier to get

Let us not count!

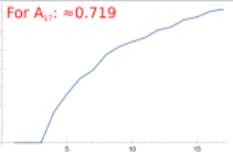

- To determine **precisely** whether a graph is Hamiltonian is difficult
- To determine **approximately** whether a graph is Hamiltonian is easy
- **Pósa-1976** Choosing a graph randomly, the **probability is 1** that the graph is Hamiltonian:  $\lim_{n \rightarrow \infty} P(\text{Hamilton}) = 1$  (probability)

What about representation theory?

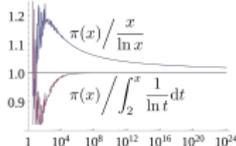

For  $A_{17}$ :  $\approx 0.719$

for up to  $A_{16}$ :

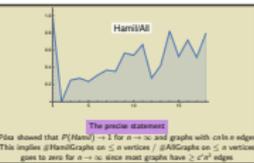

- **Miller -2013** Choosing  $S_n, g \in S_n$ , and  $\chi$  simple character of  $S_n$ , randomly, the **probability is 1** that  $\chi(g) = 0$  (formally,  $\lim_{n \rightarrow \infty} P(\chi(g) = 0) = 1$ )
- $\lim_{n \rightarrow \infty} P(\chi(C) = 0) = ?$ , but this is likely **neither 0 nor 1**

Let us not count!

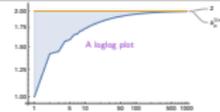

- Counting primes is **difficult** but...
- **Prime number theorem (many people -1793)** #primes  $\approx \pi(x) \approx x/\ln x$

Let us

- The **proof** of this theorem is a not difficult counting argument
- In general, **graph theory** provide many statements of the form "XXX is very difficult, but we can solve it approximately"

What about representation theory?

- $b_n := \sum_{\chi \in \hat{V}_n} \text{number of indecomposable summands of } V_n^{\otimes n}$  (with multiplicities)
- **Example**  $\Gamma = S_{2k}, K = \mathbb{C}, V = \mathbb{C}^2$ , then  $[1, 1, 2, 3, 6, 10, 20, 35, 70, 126, 252]$ ,  $b_n$  for  $n = 0, \dots, 10$
- $\lim_{n \rightarrow \infty} \sqrt[n]{b_n}$  seems to converge to  $2 = \dim V = \sqrt[n]{b_n} \approx 1.92455$

Let

**Randomly counting is difficult**

Legendre	Legendre	Legendre	Legendre
Number of primes $\leq x$			
1000	1000	1000	1000
10000	10000	10000	10000
100000	100000	100000	100000
1000000	1000000	1000000	1000000
10000000	10000000	10000000	10000000
100000000	100000000	100000000	100000000
1000000000	1000000000	1000000000	1000000000
10000000000	10000000000	10000000000	10000000000
100000000000	100000000000	100000000000	100000000000
1000000000000	1000000000000	1000000000000	1000000000000
10000000000000	10000000000000	10000000000000	10000000000000
100000000000000	100000000000000	100000000000000	100000000000000
1000000000000000	1000000000000000	1000000000000000	1000000000000000
10000000000000000	10000000000000000	10000000000000000	10000000000000000

1000000000000000000	1000000000000000000	1000000000000000000	1000000000000000000

**Legendre -1800**  
(for  $n = (n-1)0.02364$ )

Caes, Legendre and company counted primes up to  $n = 400000$  and more

That took years

The prime number theorem gave birth to **analytic number theory**

► **Caes** Analytic number theory is full of "discrete statements solved approximately"

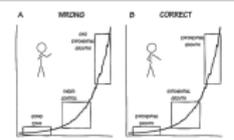

► **Prime number theorem (many people -1793)** #primes  $\approx \pi(x) \approx x/\ln x$

What about representation theory?

- **Problem** Determine for which  $g \in G$  we have  $\chi(g) = 0$  (Too hard)
- **Basic(?) problem**  $P(\chi(g) = 0)$  or  $P(\chi(C) = 0)$  for randomly chosen  $g \in G$  or conjugacy class  $C$

What about representation theory?

Caesler-Etingof-Ostrik -2023 We have

$$\beta = \lim_{n \rightarrow \infty} \sqrt[n]{b_n} = \dim V$$

Thanks for your attention!
